Comparisons of gage heights and both surface and bottom conductivity measurements at the two Peace River gage locations, Harbour Heights (river kilometer 15.5) and Peace River Heights (river kilometer 26.7), are presented in Figures 5.12 through 5.23 for the first two weeks in May 2002 (dry-season) and the last two weeks in September 2002 (wet- season). An overview of these graphics is presented in Table 5.2.

As indicated in comparing the series of figures, both surface and bottom conductivities at the downstream Harbour Heights site (river kilometer 15.5) were very strongly influenced by tide when river flows were low. During May, in the dry-season, it was not uncommon for surface and bottom conductivities to vary 7000 to 13000 uS/cm (roughly 5 to 9 ppt salinity) over a tidal cycle. During September, in the wet-season, this area of the Peace River was characteristically far fresher and daily tidal influences were greatly reduced.

Upstream, the conductivity data collected during May 2002 at the continuous gage at Peace River Heights (river kilometer 26.7) showed tidal variations in conductivity (6000 to 10000 uS/cm). During the wet-season (September), conductivities were extremely low and observed variations showed little tidal influence.
