INTRODUCTION

The Permittee is required by the MS4 permit to operate and maintain public streets, roads, highways, and rights-of-way in a manner to reduce the discharge of pollutants into stormwater.

• PART III.A.3 ROADWAYS

The components of the Roadway Street Sweeping Program are:

STREET SWEEPING

The Permittee must maintain a written description of the street sweeping program, including an estimate of the total miles in the program and the frequency of sweeping. Material collected must be measured (by weight or volume) and documented for reporting purposes. The amount of phosphorus and nitrogen load removed as a result of the street sweeping collections, must be calculated using the FDEP/FSA Nutrient Load Reduction Assessment Tool and reported annually. The tool is the result of a study by the Florida Stormwater Association and the University of Florida.

The following documentation will be used to complete the annual report:

• The roadways included in Sarasota County’s street sweeping program.
• A map or the maintenance contracts spreadsheets depicting the total miles addressed under the street sweeping program.
• The mass of TP (lb) and TN (lb) removed through the street sweeping program. The totals will be provided using the calculations in the FSA study.
• By Contract, the Contractor is responsible for disposing of collected material in accordance with local, state and federal regulations.
